 Claude Code v2.1.296 - Sonnet 5.5 - Claude Pro - C:\Users\Anagha

> "C:\Users\Anagha\Downloads\Lab_4_VibeCoding_Student_handout.pdf"
  https://github.com/Ana-9211/PES1UG24CS058-Software-Engineering-Lab-01  I need this done

  Read 1 file
  Bash(gh repo view ...)  -> gh: command not found
  Bash(git clone .../PES1UG24CS058-Software-Engineering-Lab-01 lab-repo ...)  -> docs only, no ga
me code

Claude: Your link is your own Lab-01 repo. It holds SRS and docs, with no Python game and no READ
ME listing features.
        The handout says the assigned game repo is under SETAPESU26.

User answered: https://github.com/SETAPESU26/01_frogger - ignore the lab 01 repo. I'll make a new
 one for this so you can upload this there

  Bash(git clone https://github.com/SETAPESU26/01_frogger frogger ...)
  Bash(cat README.md and all game/*.py)
  Bash(write game/collisions.py, edit game/game_engine.py, game/renderer.py, headless test script
)
  Bash(pip install pygame) -> failed to build on Python 3.14
  Bash(pip install pygame-ce) -> installed, test: ok

Claude: Code done, tested headless. Videos and chat history not done, and no push yet.

  Changes:
  - Task 1, collision: bug was collisions.py checking only the cell under a vehicle's left edge,
so wide trucks
    missed. Now uses rect overlap.
  - Task 2, lives: 3 lives. On hit the frog respawns and the timer resets. Zero lives gives Game
Over.
  - Task 3, goal and score: each goal reach adds 1 and respawns the frog. At 3 you win (WIN_SCORE
 in
    game_engine.py; the README doesn't specify). Score shows in the HUD.
  - Task 4, timer: 30 seconds per attempt, shown in the HUD, red at 5 seconds or less. Timeout co
sts a life.
  - R: restarts from any state.

  Checked with a headless script: wide-vehicle hit, timeout, scoring, win, restart, game over, dr
awing - all passed.
  pygame will not build on Python 3.14; pygame-ce was installed instead.

> you record the video, you do the pip install, babe you have access to all my laptop, use plugin
s or skills to
  access captures and do it all. I'll make the repo later. I'll leave the laptop alone for you

  Bash(which ffmpeg ...)  -> ffmpeg found
  Bash(git worktree of original code; driver script; ffmpeg gdigrab capture)  -> first attempts h
ad capture errors
  Read screenshots -> wrong capture region
  Bash(DPI-aware driver, capture region from window rect)  -> clean capture
  Read screenshots -> verified before/after frames
  Bash(re-record after clip starting hops earlier) -> score reached 2/3
  Bash(assemble Lab-4 folder: before.mp4, after.mp4, code/, summary)

Claude: Videos recorded and the Lab-4 folder is ready. Nothing is pushed.
  - before.mp4: 10 seconds on the original code, with a truck passing over the frog in its lane.
  - after.mp4: 10 seconds on the fixed code. The frog gets hit, loses a life and respawns. HUD sh
ows score,
    lives and timer; score reaches 2/3.
  - Both videos are scripted, not hand-played. A script sets up the truck in the frog's lane, and
 in the after
    clip it clears the vehicles so the frog can reach the goal. A real timeout or Game Over was n
ot shown on
    video; the headless test covered both.
```

> here's an export. Do it. And push it to the same lab 01 repo by making a folder for lab 04
